

Short Battery Life on Mobile Systems (Notebooks)

Larger hard disks on mobile systems mean higher demands on batteries. O&O Defrag V8.0 can solve this problem through defragmentation specifically optimized for mobile systems.

The Problem

Today's notebooks or Tablet PCs are being equipped with larger and larger hard disks in order to meet users' demands for more mobile storage space. Despite improved energy savings through the use of both power management software and less demanding hardware, users are continually faced with the issue of short battery life. An investigation as to the possible causes of this problem will generally lead to a single conclusion: heavy fragmentation of the hard disk means that the read/write heads have to work harder to maintain the same performance, leading to higher power consumption.

The Solution

By using a professional defragmentation solution the issue of disk fragmentation can be effectively neutralized, decreasing the load on the hard disk's read/write heads. This will not only ensure longer battery life, but also preserve the life of the hard disk's mechanical parts, leading to prolonged disk operation. With O&O Defrag V8.0 Professional Edition it is possible to tailor defragmentation jobs to accommodate the unique power limitations of a mobile system. This software works closely with Windows Power Management to automatically conserve power use wherever possible. O&O recommends the use of the O&O OneButtonDefrag or SPACE defragmentation methods for the optimization of mobile systems.
