

Lagging Performance on CAD Workstations

Modern CAD programs require high-end PCs with high performance components in order to run resource-intensive drafting operations. Because work of this kind requires the reading and writing of very large files, the hard disk must contend with higher than average system loads. The regular defragmentation of the hard disk with O&O Defrag V8.0 Professional Edition can help to resolve this problem.

The Problem

Despite the most modern hardware components, CAD Workstations are prone to lagging performance. Whether it be the opening or editing of large drafting files, working with large files leads to the heavy fragmentation of the hard disk. A highly fragmented hard disk means that the read/write mechanism inside has to work very hard to maintain normal performance. Eventually, the hard disk cannot keep up, leading to performance decreases and possibly disk failure. This effect is only exacerbated by the high loads placed on the main memory and in turn the Windows page file, which operates in tandem according to the level of memory use.

The Solution

The new O&O Defrag V8.0 Professional Edition for Windows unlocks the hidden Performance of your computer. This software optimizes your hard disk in Windows XP Home, Windows XP Professional, Windows 2000 Professional, and Windows NT 4 Workstation, securely repacking fragmented files together for more efficiency. In addition, O&O Defrag V8.0 Professional Edition boasts outstanding usability and a myriad of important functions not found in any other defragmentation software platforms on the market today.
